

GoldQuest operates in the Dominican Republic, where the focus is in San Juan province. The Company discovered the Romero deposit in 2012 and the Romero South deposit in 2006. The development of the Romero Project is outlined in the tab labelled Romero Project. The surrounding land package is described in the tab labelled The Tireo Project. Exploration is underway to identify additional mineralization in the underexplored volcanic Tireo Formation, based on a 2014 airborne geophysical survey and over 12 years of “on the ground” exploration expertise.

In addition, the company issued the first 43-101 report on Las Animas, a high grade Volcanogenic Massive Sulphide (“VMS”) deposit in 2012, which can be viewed in the Other Properties section.
